

# Incremental Hollow Shaft Encoder

## OPE1275H Single Channel (Tachometer)

## OPE2275H Dual Channel

### Features:

- O.D. = 28mm [1.10"]
- Motor Shaft Diameter 2 mm [0.079"]
- Motor Shaft length 3.8 mm [0.150"] minimum
- Pulses per revolution 256 maximum
- Analog Output
- 100 - 5,000 RPM

### Description:

The **OPE1275H** and **OPE2275H** are designed for small shafted motors with a shaft diameter of 2 mm [0.079"] and a minimum length of 3.8 mm [0.150"]. The **OPE1275H** provides a single channel analog output for speed of rotation while the **OPE2275H** provides a dual channel analog output for speed and direction of rotation.

The output of the **OPE1275H** provides a rise and fall pulse providing the designer two slopes for each pulse doubling the count capability. The **OPE2275H** provides quadrature rise and fall pulse patterns providing the design engineer 4 times the pulse per revolution count.

The **OPE1275H** and **OPE2275H** are very easy to assemble on your motor shaft using a #1 Phillips screwdriver.

Power requirements are 5 volts  $\pm$  .5 volts.

Electrical connection is achieved with a 4-pin Molex 53048-0410 connector providing V+, Ground and Output pins. The mating connector is a 4-pin Molex 51021-0400 (Terminal pin 50058 or 50079) or equivalent.

Mounting of the hollow shaft version of the **OPE1275** and **OPE2275** is achieved with a stick-on transfer adhesive pre-applied to the back of the housing. Just peel off the protective base and press the encoder to your motor.

Frequency response is from DC to 25 kHz providing a maximum of 256 cycles per revolution (CPR)

This product is designed for general encoding for low-speed applications.

### Applications:

- Printer motors
- Machine automation
- Machine safety

### Ordering Information

**OPE X 275 H - ZZZ**

OPTEK Product Encoder

Channels:

1 = Single channel  
2 = Dual Channel

Motor Diameter- 27.5mm

Resolution per revolution:

128 holes per revolution  
256 holes per revolution

Shaft Configuration:

H = Hollow Shaft

RoHS

### Absolute Maximum Ratings ( $T_A=25^{\circ}\text{C}$ unless otherwise noted)

	Maximum	Units
Storage Temperature Range	$-40^{\circ}\text{C}$ to $+85^{\circ}$	C
Operating Temperature Range	$0^{\circ}\text{C}$ to $+85^{\circ}$	C
Power Supply Voltage $V_{CC}$	4.5 to 5.5	$V_{DC}$
Power Dissipation <sup>(2)</sup>	250	mW
Vibration (5 Hz to 2 kHz)	20	g
Shaft Axial Play	$\pm 0.51\text{ mm}$ [0.02"]	
Off-Axis Mounting Tolerance	0.254 mm [0.01"]	
Acceleration	250,000	$\text{rad/sec}^2$

### Mechanical Specifications:

	Dimensions	Units
Moment of Inertia	$6.48 \times 10^{-5}$	OZ-IN-S <sup>2</sup>
Shaft Length	0.3 to 0.7	Inches

### Electrical Characteristics ( $T_A = 25^{\circ}\text{C}$ unless otherwise noted — for reference only)

SYMBOL	PARAMETER	MIN	TYP	MAX	UNITS	TEST CONDITIONS
$V_{CC}$	Supply Voltage	4.5	5.0	5.5	V	
$I_{CC}$	Supply Current	-	21	27	mA	$V_{CC} = 5.0\text{ volts}$
$V_{OH}$	High Level Output Voltage	$V_{CC}-0.5$	-	-	V	$I_C = 100\text{ }\mu\text{A}$
$V_{OL}$	Low Level Output Voltage	-	-	0.4	V	$I_C = 20\text{ mA}$
TR	Rise Time	-	500	-	ns	10% to 90%, $V_{CC} = 5.0\text{ volts}$
TF	Fall Time	-	100	-	ns	10% to 90%, $V_{CC} = 5.0\text{ volts}$
FR	Frequency Response	-	-	60	kHz	
H.S.	Hole Size	0.10	-	-	inch	
Rotation	Maximum speed of rotation with 1024 holes per rotation	-	-	100	rev/sec	

### Encoding Characteristics:

SE	Symmetry Error	0	16	75	$^{\circ}\text{e}$	
QE	Quadrature Error—OPE2275H only	0	12	60		

#### Notes:

1. All parameters measured using pulse technique,  $V_{CC} = 5.0\text{ volts}$  and  $T_A = 25^{\circ}\text{C}$ .

### Timing Diagram:

### Timing Definitions:

**PPR** = Pulses Per Revolution

**Electrical Degree** ( $^{\circ}e$ ) =  $1/360$ th of 1 cycle

**Cycle** = 360 electrical degrees ( $^{\circ}e$ )

**Symmetry** = Relationship between X & Y in electrical degrees ( $^{\circ}e$ ).

**Position Error** = The difference between the actual shaft position and the position indicated by the encoder cycle count.

**Quadrature**: The lead or lag difference between channels "A" and "B" in electrical degrees (normally  $90^{\circ}e$ )

**Cycle Error** = The difference between the actual shaft rotational position and the cycle count rotational position.

**Rise Time** = Time required to switch between 10% and 90% of the highest to lowest signal levels.

**Fall Time** = Time required to switch between 90% and 10% of the highest to lowest signal levels.

### Hollow Shaft Assembly Instructions:

Make sure the kit has all required parts:

- 1 each Base Unit
- 1 each Base Unit Alignment Tool
- 1 each Aperture Plate
- 1 each Encoder Wheel Assembly
- 1 each Wheel Assembly Alignment Tool
- 1 each Reflective Lid
- 4 each #2-56 self tapping screws

1. Peel the protective covering from the adhesive on the back of the Base Unit.
2. To center the Base unit, carefully slide the Base Unit over the flange on the motor and press firmly.
3. Place the Aperture Plate on the Base Unit.
4. Slide the Encoder Wheel Assembly over the motor shaft until it almost touches the Aperture Plate.
5. Carefully place the Reflective Lid on the encoder (rotate as necessary to align) and attach with 4 #2 self tapping screws (provided).
6. Connect the electrical interface to the encoder.
